

Saint Joseph Regional Medical Center  
South Bend, Indiana

### **ANNUAL SKIN CANCER SCREENING**

A total of 229 participants were screened in six hours at the screening held at Saint Joseph Regional Medical Center. Five area dermatologists participated.

Based on the assessments performed 48% of the participants were referred for further follow-up and a biopsy was recommended for 19%.

The diagnoses of the lesions varied. Ten possible melanomas, 27 basal cell carcinomas and 2 squamous cell carcinomas were identified.

Sixty-nine percent of the participants noted that they had never attended a skin cancer screening. This number is down from last years review. Last year 85% of the participants stated they had never attended a screening.

The newspaper was referenced most as the way that the participants found out about the screening.

Attached is a breakdown of the data from the screening:
